

# CloudCentral Enterprise File Sync & Share

An Australian enterprise Dropbox alternative

## At a Glance

---

Enterprise File Sync & Share enables you to synchronise and share documents across your business

All data is kept within Australia to ensure data sovereignty and security

Encrypt your data with government grade AES-256 encryption to protect your data

Each file is replicated across three data centres for availability and redundancy

Version history allows you to recover old versions of files and audit changes

Control access to folders and files with user and group based access control

Integrates with CTERA storage appliances for hybrid cloud deployments

24x7 Australian support with service level agreement

## Benefits

---

Share files across your team

Accessible from home & work

Keep your data in sync across all devices

Unlimited storage capacity

Grows with your business

Windows, Mac, IOS and Android clients

## Overview

CloudCentral Enterprise File Sync & Share is an Australian enterprise alternative to Dropbox.

The service enables enterprises to replace traditional file shares with globally accessible file sharing and synchronisation so that everyone in the business can access the files no matter where they are or what type of device they have.

Share files between team members to collaborate on projects whilst enabling access to be controlled securely based on user group and role memberships.

Government grade AES-256 encryption can be enabled to ensure your data is protected. You control the encryption keys meaning that no one can view or access your data without your authorisation.

The service supports the deployment of CTERA cloud storage gateways onsite to accelerate access to files for users working within corporate office environments.

A self service web portal enables nominated administrators to self manage the storage environment, create new users, create folders and manage group and security role memberships.

All data is stored within Australia for assured data sovereignty and low latency data access. Files are replicated across three data centres within Australia for data protection and continuous availability.

Native clients for Windows, Mac, iPhone/iPad and Android allow users to access files from any device. Files and Folders appear within Windows Explorer and Mac OS X finder as native windows enabling users to work with data in a familiar consistent way.
